# Trce

The Multi-Tenant Operational Intelligence Platform for Industrial Supply Chains.

02 — THE PROBLEM

# Industrial downtime is expensive and siloed.

## $260K

Average cost of unplanned downtime per hour in heavy industry.

## 2 silos

Factory telemetry (SCADA) and inventory (ERP) live in isolated systems.

## Hours

Operators phone facilities to find a spare part after a failure.

# Unified Intelligence. Instant Action.

Trce bridges machine health and distributed logistics. It detects anomalies, traces network inventory, and optimizes part transfers to minimize downtime exposure.

04 — CORE CAPABILITIES

# How Trce works

01

## Live Telemetry Ingestion

Real-time vibration and temperature threshold evaluation.

02

## Algorithmic Routing Engine

Ranks supplier facilities by distance, ETA, and net downtime savings.

03

## Cryptographic Ledger

Secures dispatch manifests with SHA-256 integrity hashes.

05 — TECHNICAL ARCHITECTURE

# Enterprise-grade and multi-tenant

### FRONTEND

Next.js 14, React, Tailwind CSS, Recharts

### BACKEND / DATABASE

Supabase (PostgreSQL)

### SECURITY

Native Row-Level Security isolates each tenant, e.g. by @apexindustrial.com

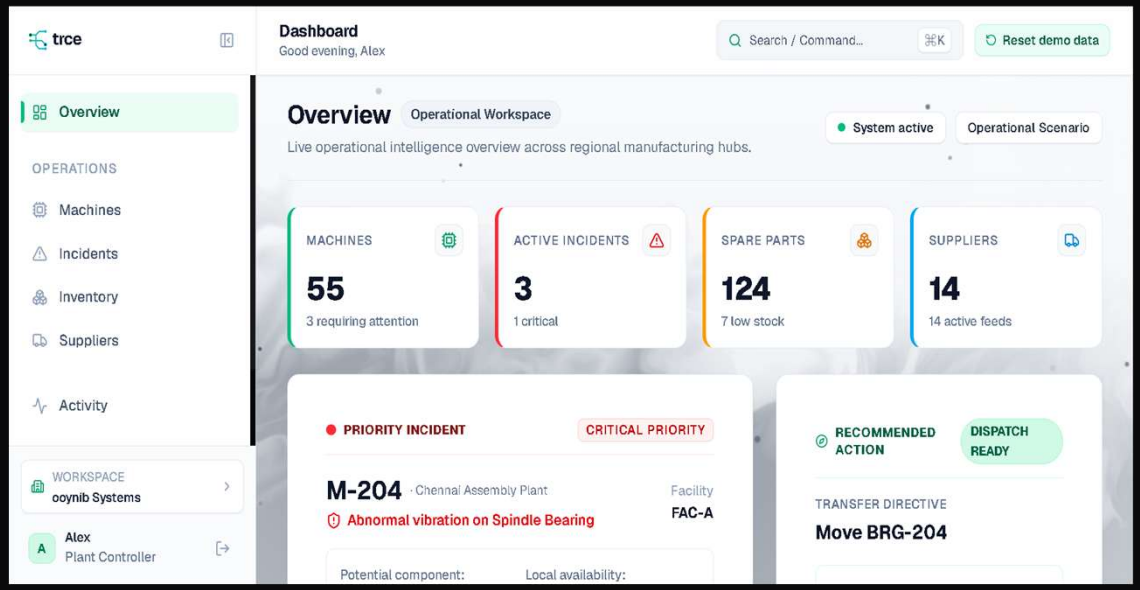

### INGESTION

Custom CSV parser with schema normalization and error quarantining

06 — BUSINESS ROI

# The financial impact

Trce doesn't just find parts. It calculates exact net operational savings by comparing transit times against hourly downtime burn rates.

07 — HACKATHON TECHNICAL FEATS

# Built for the floor

## ⌘ K

Global operational command palette for high-stress scenarios.

## 4K → tablet

Fluid responsive design from control rooms to rugged tablets, zero horizontal overflow.

## Live

Real-time visual fault injection simulator.

# Trce is ready for deployment.
